# Research on Personal Finance

## Abstract:

This report focuses on analyzing the **financial behavior** of young adults through a **survey** conducted with **121 respondents**. The key aspects explored in the survey include **pocket money management**, **spending habits**, **financial sufficiency**, and **confidence in managing finances**. By analyzing variables such as **spendings on public transport**, **gasoline costs**, **mobile service bills**, **budgeting practices**, and **savings habits**, the report aims to assess the ability of individuals to manage their finances effectively. The primary goal of the study is to **predict how these factors influence confidence in managing finances** using **statistical and machine learning models**.

The report utilizes a **linear regression model** to analyze the relationship between **independent variables** (such as spending habits and financial behaviors) and the **dependent variable** (**confidence in managing finances**). The model's performance is evaluated using key metrics like **Mean Absolute Error (0.464)**, **Mean Squared Error (0.347)**, and a **$R^2$ score of 0.71**, indicating a **strong predictive power**.

---

## Introduction:

The dataset examines the financial habits of **university students**, focusing on their ability to manage pocket money and make informed financial decisions. It includes 121 responses, with data on "age, semester, gender, living status, pocket money range, and various spending categories like public transport, gasoline, rent, and mobile bills. It also covers aspects such as budgeting, spending tracking, and confidence in managing finances, offering insights into the financial behavior and challenges faced by young adults".

- **Problem Statement:**

  Most of the university students experience difficulties while managing their pocket money due to low financial education, low budgeting and not keeping a proper track of their spendings. Student budgets often fall short well before the month ends, forcing them to take short-term measures to pay for their expenses. Personal factors like age, gender, semester and livelihood can influence a student's financial confidence and decision making. For students, it is also important to understand these patterns and develop effective financial management strategies so they can identify the main difficulties in saving money.

- **Research Objectives:**

  The research objectives of this study are:

  - To analyze the **financial behavior** of university students, focusing on their pocket money management, budgeting habits, and expenditure patterns.
  - To assess the **relationship** between **personal demographics** (age, semester, gender, living status) and financial management skills.

- To determine the factors contributing to financial confidence and the challenges students face in saving money.
- To evaluate the **effectiveness** of **budgeting** and spending tracking on students' financial stability.
- To identify the major **financial challenges** faced by students and the strategies they use to manage shortfalls.

## ➢ Research Questions:

- How much do you spend on Public Transport and Gasoline?
- Do you budget your Pocket Money?
- Do you track your spending?
- How often do you run out of money before the end of the month?
- If you run out of money, how do you manage the shortfall?
- What is the biggest challenge you face while saving?
- Do you save a portion of your Pocket Money?
- What percentage of your Pocket Money do you save?
- Are you confident in managing your finances?

## ➢ Future Course of Action:

The future course of action for this research involves several key steps to enhance the analysis and improve the results. First, expanding data collection by **gathering more responses** would strengthen the dataset and make the conclusions more representative. Additionally, refining the data processing methods will help address any inconsistencies or missing values, ensuring accuracy.

**Advanced statistical analysis** should be conducted, focusing on correlation analysis between demographics and financial behavior. Segmentation of students based on their financial practices could also provide deeper insights into different groups' challenges and habits.

Finally, **expanding the survey** with more questions on financial literacy and extracurricular income sources would allow for a broader understanding of student finances. Longitudinal studies and follow-up surveys can track changes in financial behavior over time, offering insight into the effectiveness of any interventions.

## ➢ Variables used in Research →

- Dependent Variable: Spending Pocket Money.
- Independent Variable: Pocket money.
- Moderator: Living Status.
- Mediator: Budgeting Pocket Money.

- **The relationships between these variables are as follows:**

1. **Pocket Money (Independent Variable) → Spending Pocket Money:**

   Pocket money directly affects spending behavior, with higher or lower amounts influencing how students allocate resources.

2. **Living Status impacts → Pocket Money → Spending Pocket Money:**

   Living status moderates this relationship, as students living independently may spend more on essentials compared to those living with family.

3. **Pocket Money → Budgeting Pocket Money (Mediator) → Spending Pocket Money:**

   Budgeting mediates the relationship, with effective budgeting leading to more controlled spending, regardless of the amount of pocket money received.

4. **Living Status → Budgeting Pocket Money → Spending Pocket Money:**

   Living status indirectly affects spending by shaping budgeting practices, which in turn influence spending habits.

---

## Literature Review:

Managing personal finances is an important part of life. It affects how people build wealth, handle emergencies, and reach their long-term financial goals. Research on personal finance looks at topics like budgeting, saving, managing debt, and financial knowledge. Reviewing existing studies helps us understand what influences financial decisions, how education affects money management, and ways to improve financial stability. This review brings together current research to show key trends, identify gaps, and offer useful insights for better financial practices and policies.

The need for financial education reforms starting from high school, alongside mandatory personal finance courses at the university level, is crucial to better equip students for real-life financial decisions (Ansong, 2011). College students face significant financial challenges, often lacking the knowledge to make informed decisions. Universities should adopt a multi-channel approach to financial education to support student well-being and long-term financial success (Goetz et al., 2011). There is a need for targeted financial education programs, especially in areas like saving, spending, and debt management, to close the knowledge gap and better equip students for future financial decisions (van Deventer, 2020). Financial education reduces impulsive spending and ensures stability, though poor habits arise without financial education (Zimmerman & Katon, 2005). Women tend to worry more about finances, make unplanned purchases, and are more dissatisfied with their current financial situation. Meanwhile, men are more satisfied with their ability to meet long-term goals but still express dissatisfaction with their savings levels (Hira & Mugenda, 2000).

University students have inadequate knowledge of personal investment. Female students are less knowledgeable about investing than male students, while non-business majors are less knowledgeable than business majors (Volpe, Chen, & Pavlicko, 1996). College students are not knowledgeable about personal finance, and the low level of knowledge limits their ability to make informed financial decisions (Chen & Volpe, 1998). The gender differences in personal financial literacy among college students indicate that women generally have less knowledge about personal finance topics. Education and experience significantly impact financial literacy for both men and women (Chen & Volpe, 2002). A study of students in a regional Australian university found that financial literacy was not high enough, likely stemming from the lack of financial-skills education in high schools (Beal & Delpachitra, 2003). The principal, teachers, children, and their families were enthusiastic about the saving program, which successfully taught financial education through an after-school club (Sherraden et al., 2007).

Financial attitudes and investment knowledge among university students are influenced by their field of study and economic crises, emphasizing the need for early financial education and practical experience. The findings contribute valuable regional insights to global financial education discussions (Fan et al., 2021). Turkish university students have low levels of financial literacy, particularly in areas like portfolio management and investment knowledge. Factors such as class rank, family income, parental education, and discussions about finances with parents significantly influence financial literacy (Altintas, 2011). There is a critical need for financial education among Millennial college students, emphasizing self-advocacy, independence, and responsible money management. Universities, especially Christian-based institutions, should implement proactive financial literacy programs to equip students for long-term financial success (Raphael & Lloyd, 2004). Residents' financial decisions appear similar to those of the general population, but surgical residents exhibit financial patterns that may be problematic. Further study is warranted (Fries, Starr-McCluer, & Sunden, 1998).

Financial literacy is crucial for better financial management and inclusion, especially in developing countries. While education programs show promise, their impact remains inconclusive (Kebede, Kaur, & Kuar, 2015). Financial education is essential but lacks integration into school curricula. Economics can provide a structured framework for better financial literacy (Morton, 2005). Personal financial management behavior is influenced by various factors, including demographics, psychology, and financial literacy. Understanding these determinants can help improve financial well-being and satisfaction (Goyal, Kumar, & Xiao, 2021). Workplace financial education significantly improves employees' financial wellness, leading to better financial decisions, higher retirement contributions, and reduced financial stress (Garman et al., 1999). Integrating emotional intelligence and personal finance education into academic curricula enhances students' financial decision-making and professional development. Their synergy fosters resilience, financial independence, and better financial behaviors (Imam et al., 2022).

College students have a low level of financial literacy. Factors such as gender, academic discipline, class rank, and work experience significantly influence financial knowledge, highlighting the need for better financial education programs (Chen & Volpe, 1998). Undergraduate students at

Universitas Pasundan have low financial literacy, influenced by gender, GPA, parental education, and parental income. The study suggests improving financial education to enhance students' ability to manage personal finances effectively (Gunardi, Ridwan, & Sudarjah, 2017). One study emphasizes the importance of teaching financial literacy to college students by focusing on real-life financial decisions they face immediately after graduation. The course integrates behavioral finance concepts to help students recognize biases and make better financial choices (Riley, 2015). There is a growing need for financial education due to a complex financial marketplace. Research on the history of personal finance education discusses current challenges and emphasizes the importance of informed financial decision-making for long-term economic well-being (Hira, 2009). Students with low financial literacy tend to be overconfident, risk-loving, and impatient, highlighting the need for targeted financial education (Mudzingiri, Mwamba, & Keyser, 2018).

## ➢ Theoretical Framework:

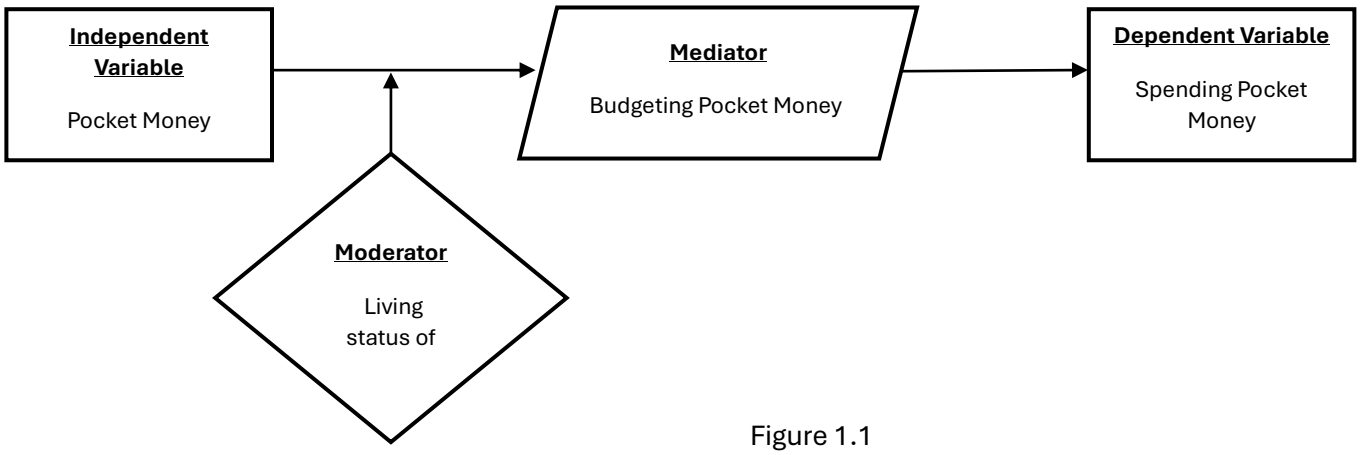

Figure 1.1

## ➢ Hypothesis using theoretical framework:

- **H1:**
  *The more pocket money students receive, the more they spend.*
- **H2:**
  *Students who live independently spend more of their pocket money compared to those living with family or in hostels.*

- **H3:**
  *Students who budget their pocket money spend it more carefully, regardless of how much money they have.*
- **H4:**
  *The way students live (independently or with family) affects how budgeting influences their spending of pocket money.*

---

## Methodology:

### ➢ Research Design

The research design will follow a quantitative approach, utilizing statistical tools to analyze the relationship between financial behaviors and demographic factors among university students. A survey will be conducted to gather numerical data related to pocket money management, budgeting habits, and expenditure patterns.

### ➢ Research Type

This study will employ a **descriptive research** type to explore the financial behavior of university students. Additionally, it will incorporate correlational analysis to examine the relationships between various independent and dependent variables such as age, gender, and living status.

### ➢ Data Collection

Data will be collected through a **structured questionnaire**. The survey will focus on university students' financial management behaviors, spending habits, and budgeting practices.

### ➢ Sampling Process

The sampling technique used will be **stratified random sampling**. This approach ensures that all subgroups of the population (e.g., students from different faculties, age groups, or living arrangements) are properly represented in the sample. The sample size will be 121 university students.

### ➢ Data Collection Types

The data will be collected **cross-sectionally**, meaning all the data will be gathered at a single point in time to provide a snapshot of financial behaviors at that moment.

### ➢ Data Analysis Techniques

Data will be analyzed using statistical software such as SPSS or Excel. Techniques will include:

- Descriptive statistics for summarizing data (mean, median, mode).
- Correlation analysis to identify relationships between variables.
- Regression analysis to predict the impact of independent variables (e.g., pocket money, living status) on the dependent variable (spending pocket money).

```

Figure 3.3

- **Multi validate Analysis:**

## Corelation:

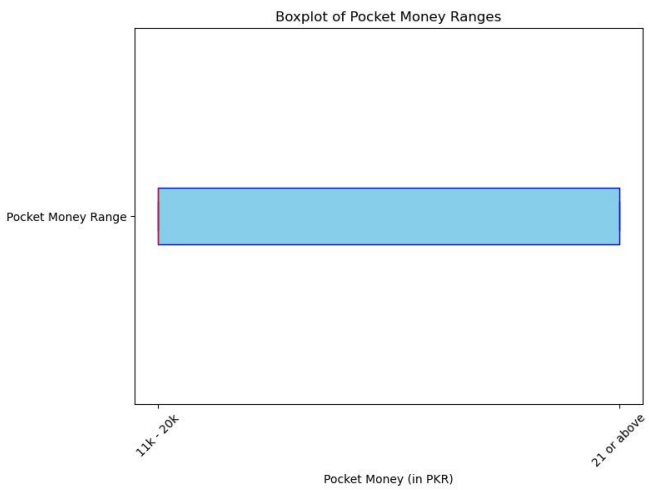

Figure 4.1

The boxplot shows the distribution of pocket money ranges. Many respondents fall within the ***"11K-20K"*** range. There are a few outliers in the "**21K or above**" range, indicating that some individuals receive significantly higher pocket money compared to the majority.

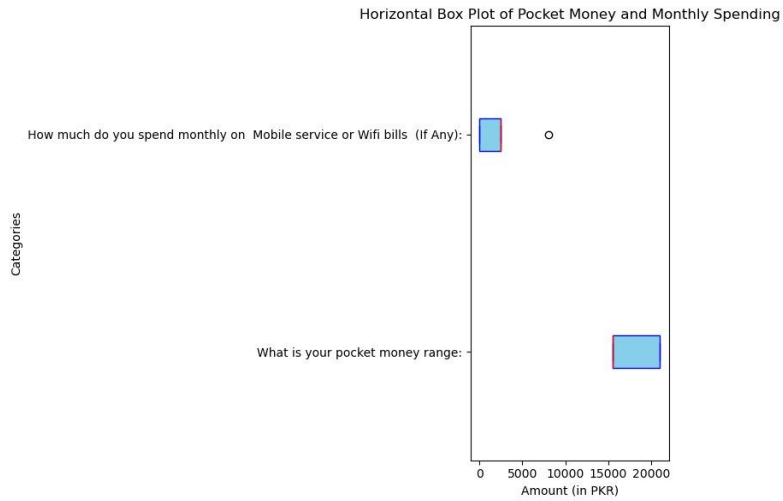

Figure 4.2

The boxplot compares monthly **mobile/WiFi spending** across **two pocket money ranges**. Individuals in the higher pocket money range tend to have a wider range of spending, suggesting they have more variability in these expenses. There is one outlier in the lower pocket money range, indicating an individual with unusually high mobile/WiFi spending.

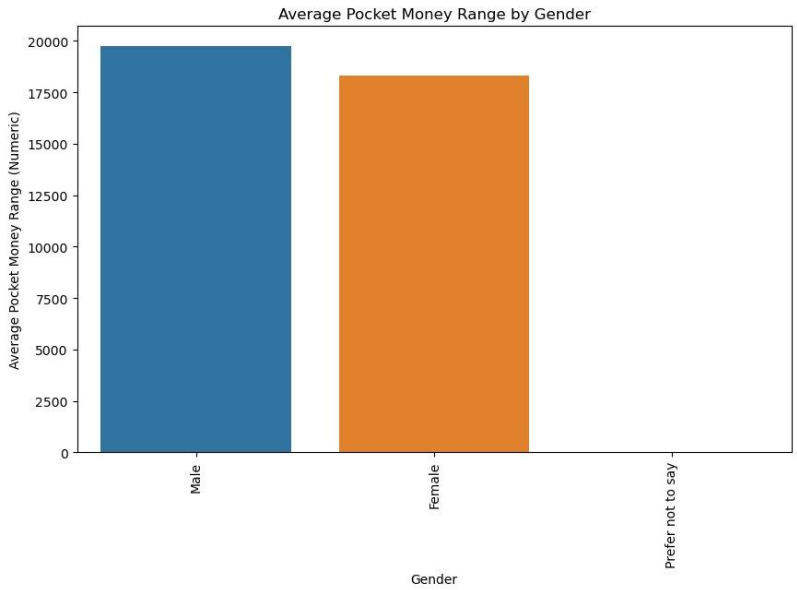

Figure 4.3

The bar chart shows the **average pocket money range** by gender. Males have a significantly higher average pocket money range compared to females. The "Prefer not to say" category has no data points.

## ➢ Correlation Matrix:

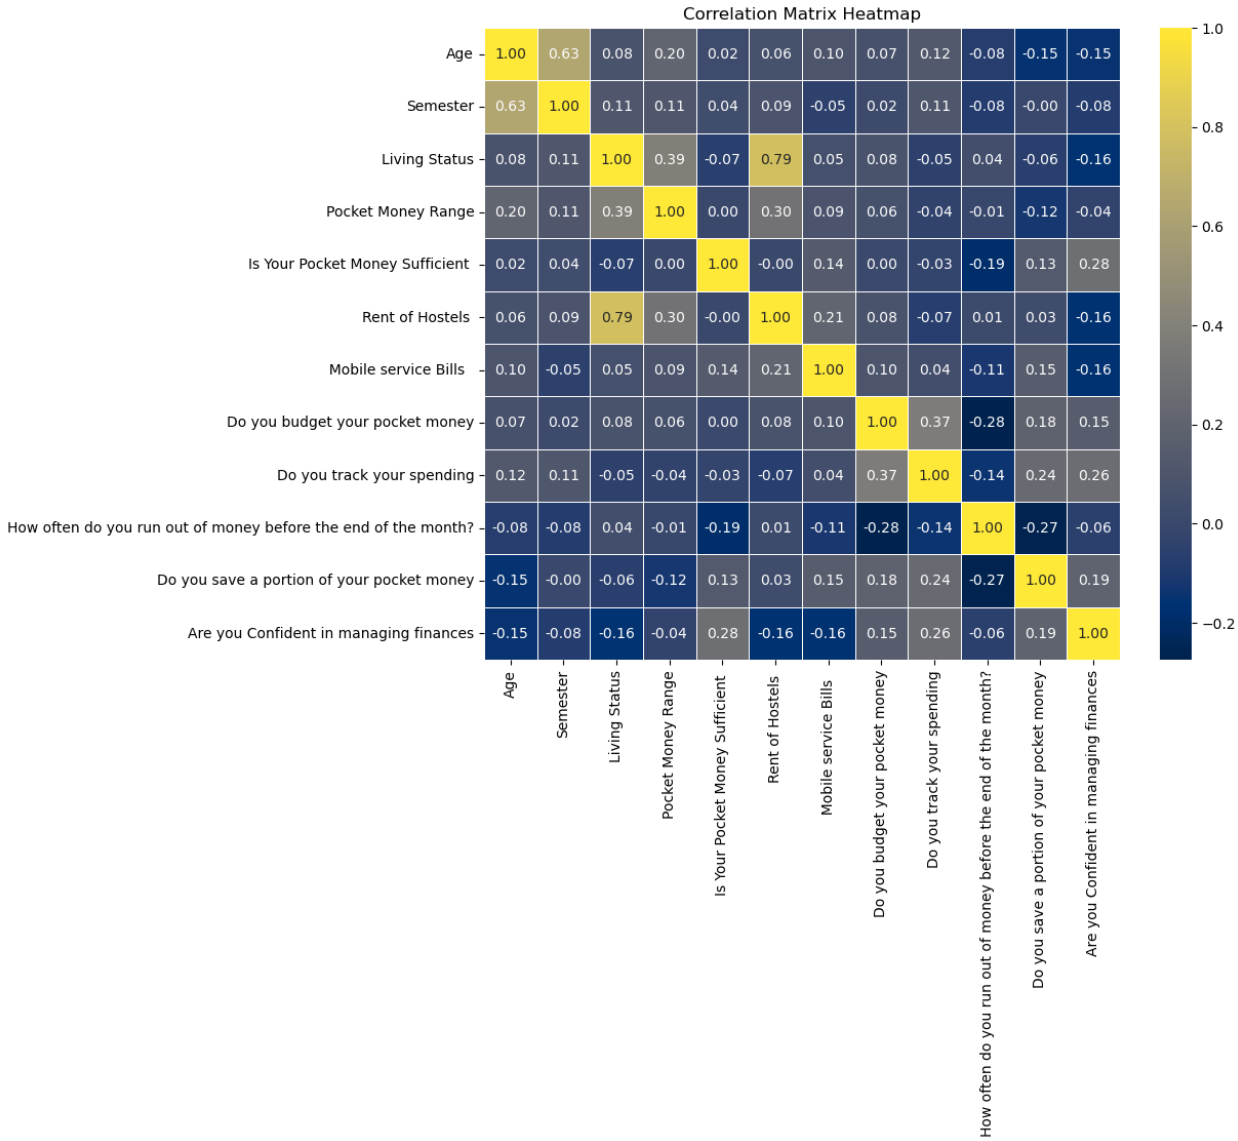

Figure 5.1

This heatmap visualizes the correlations between different variables related to student finances. Strong positive correlations are seen between living status and rent of hostels, and between budgeting and tracking spending. Strong negative correlations exist between saving money and running out of money frequently, and between saving money and confidence in managing finances.

- ## Justification:

**Strong Positive Correlation:**

- **Living Status and Rent of Hostels**: The correlation value is 0.79. This indicates a very strong positive relationship between the two variables, as expected.
- **Budgeting and Tracking Spending:** The correlation value is 0.28. This shows a moderate positive correlation, suggesting that budgeting practices are associated with a higher likelihood of tracking spending.

**Strong Negative Correlation:**

- **Saving Money and Running Out of Money Frequently:** The correlation value is -0.24. This indicates a moderate negative correlation, confirming the expectation that saving money is associated with a lower frequency of running out of money.
- **Saving Money and Confidence in Managing Finances:** The correlation value is -0.27. This shows a moderate negative correlation, supporting the notion that saving money is linked to higher confidence in managing finances.

- ## Errors:

- **Mean Absolute Error (0.4643):** On average, the model's predictions deviate from the actual values by approximately 0.4643 units. This gives us an idea of the average magnitude of the errors.
- **Mean Squared Error (0.3474):** This metric emphasizes larger errors more than MAE. A value of 0.3474 suggests that, on average, the squared difference between the predictions and actual values is 0.3474.
- **R-squared Score (0.71):** This indicates that a substantial 71% of the variability in the dependent variable can be explained by the model's independent variables. This suggests a moderate fit between the model and the data, implying that the model is effective in capturing the underlying patterns.

---

## ➢ NLP For Suggestions Column:

### Step 1:

Importing data set and then typing a code for replacing all non-letter words with spaces:

```python
import pandas as pd

# Read the CSV file
data = pd.read_csv(r"C:\Users\Hp\OneDrive\Desktop\Rtt Suggestion.csv", encoding='latin1')  # Common fallback

# View the first 5 rows
data.head()
```

Python

| | Sugessions |
|---|---|
| 0 | V |
| 1 | Always save some money for any problem |
| 2 | NO?? |
| 3 | You'll only learn actual financial management ... |
| 4 | At the start of each month, allocate a specifi... |

```python
import re
```

Python

```python
data1 = re.sub("[^a-zA-Z]",  # Search for all non-letters
               " ",          # Replace all non-letters with spaces
               str(data))
```

Python

### Step 2:

Importing NLTK Library and then typing a code for stop words and tokenization

Tokenization is the process of converting a sentence into single word.

Stopwords is used to replace the complex words to their base words.

```python
import nltk
from nltk.tokenize import word_tokenize

nltk.download('punkt')
tokens = word_tokenize(data1) #The first step is for the analyst to break down sentences into individual words (or tokens!).
print(tokens)
```

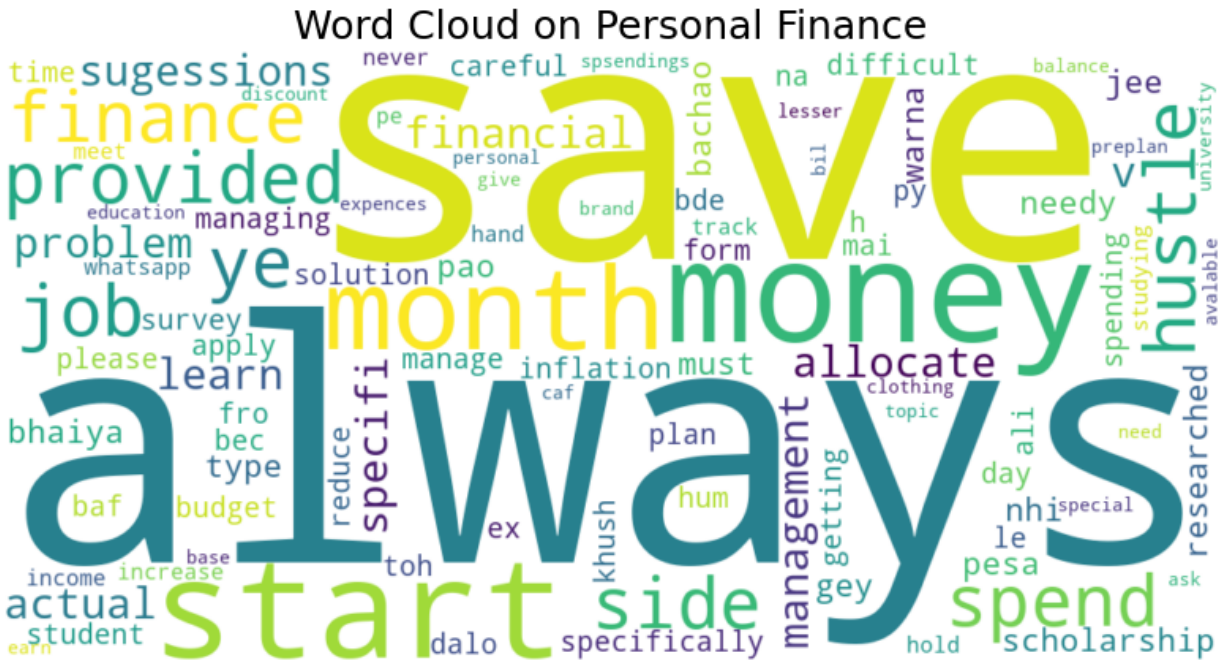
**Step 4:**

Creating a **Word Cloud:**



## Conclusion and Discussion:

The research successfully highlights the complex interplay between demographic factors, financial behaviors, and confidence in managing finances among university students. Key findings suggest that students with higher pocket money tend to spend more, but effective budgeting significantly moderates this behavior. Living independently also leads to greater financial pressure, thereby affecting spending habits.

A significant positive correlation between budgeting and spending tracking indicates that financial discipline is often accompanied by awareness and planning. Conversely, students who save money regularly are less likely to run out of funds before the month ends, enhancing their financial confidence.

The regression model, with an $R^2$ score of 0.71, demonstrates a good level of predictability in understanding financial confidence based on the selected variables. This validates the hypothesis that both internal (budgeting habits) and external (living status, pocket money) factors contribute significantly to financial behavior patterns.

## Recommendations:

Based on the research findings, the following recommendations are proposed:

1. **Introduce Financial Literacy Programs:**
   Universities should offer workshops or mandatory courses on budgeting, saving, and managing finances to equip students with essential life skills.
2. **Encourage Budgeting Tools:**
   Promoting mobile apps or simple spreadsheet templates for tracking expenses and budgeting can help students improve their financial discipline.
3. **Provide Financial Counseling:**
   On-campus counseling services should include financial advisory support to guide students facing financial stress.
4. **Support Part-Time Opportunities:**
   Facilitating part-time work or internships could enhance financial independence and budgeting experience.
5. **Customize Allowances Based on Needs:**
   Guardians should consider the student's living arrangement and needs when allocating pocket money to ensure sufficiency without overindulgence.

## Limitations:

While the study offers valuable insights, it also has certain limitations:

1. **Sample Size:** The sample was limited to 121 university students, which may not be fully representative of the broader student population.
2. **Geographic Scope:** The research is confined to one university, which may limit the generalizability of results across different regions or institutions.
3. **Self-Reported Data:** Survey responses may be influenced by social desirability bias, leading to inaccuracies in reported financial behavior.
4. **Cross-Sectional Design:** The study captures data at a single point in time, which prevents understanding of financial behavior changes over time.
5. **Limited Variables:** Other potential influencers such as part-time income, family financial support, or psychological attitudes toward money were not included.

## Appendix (Questionnaire):

# Research Tools and Techniques.

B I U

**Survey on "*Personal Finance*":**

**Student Name:** *(Optional)*

Short-answer text

**University Name** *

- COMSATS University Islamabad
- Other...

**Roll Number:** (Like: Sp23-BBD-001) *

Short-answer text

**Age** *

- 17-19
- 20-22
- 23 or above.

**Semester** *

- 1
- 2
- 3
- 4
- 5
- 6
- 7
- 8

**Gender:** *

- Male
- Female
- Prefer not to say

**What is your living status:** *

- Hosteller
- Day Scholar.

**What is your pocket money range:** *

- below 10k
- 11k - 20k
- 21 or above

**How much do you spend monthly on Public transportation fees** ( *If any*):

- 2k - 4k
- 5k - 8k
- 9k - 12k
- Other...

**How much do you spend monthly on Gasoline** (*if owning a vehicle*):

- 2k - 4k
- 5k - 8k
- 9k - 12k
- Other...

**How much do you spend monthly on Rent of hostels** (*if applicable*):

- Below 10k
- 10k - 20k
- 21k - 25k
- Other...
